Async Programming in Javascript with Await and Defer

I love many of the new tools available in javascript on the client (browsers, chrome apps, metro apps) and on the server (node). However, I get frustrated with the verbosity of asynchronous programming. We truly take for granted the simplicity of synchronous programming, of course at a cost. After pulling my hair out, I found there are lots of wonderful techniques to deal with this domain. This talk focuses on one technique that should be familiar to c# 5 developers: await and defer. First we'll look at CPS compilation/transforms and await/defer with IcedCoffeeScript and TameJs. Then we'll discuss the pros and cons of this technique compared to nested async callbacks, control flow libraries and promises. Hopefully this talk can help keep a few more hairs on your head as you explore the wonderful world of javascript programming!

Time: 3:00 PM - 4:00 PM
Room: QCi
